$$\textbf{learned parameters} = \textbf{parameters to be fixed by training with the dataset} \tag{317}$$

$$\textbf{hyperparameters} = \textbf{parameters that depends on a dataset} \tag{318}$$

$$\textbf{validation} = \textbf{partitions dataset into training and testing partitions, then evaluates the}$$
$$\textbf{accuracy of the parameters learned from the training partition in predicting the}$$
$$\textbf{outputs of the testing partition} \ \# \ \text{useful for fixing hyperparameters} \tag{319}$$

$$\textbf{cross-validation} = \textbf{average accuracy of validation for different choices of testing partition} \tag{320}$$

$$\textbf{L1} = \textbf{scales linearly} \ ; \ \textbf{L2} = \textbf{scales quadratically} \tag{321}$$

$$d = \textbf{distance} = \textbf{quantifies the the similarity between data points} \tag{322}$$

$$d_{L1}(A,B) = \sum_p |A_p - B_p| \ \# \text{ Manhattan distance} \tag{323}$$

$$d_{L2}(A,B) = \sqrt{\sum_p (A_p - B_p)^2} \ \# \text{ Euclidean distance} \tag{324}$$

$$\textbf{kNN classifier} = \textbf{classifier based on } k \textbf{ nearest data points} \tag{325}$$

$$s = \textbf{class score} = \textbf{quantifies bias towards a particular class} \tag{326}$$

$$s_{linear} = f_{c\times 1}(x_{n\times 1}, W_{c\times n}, b_{c\times 1}) = W_{c\times n} x_{n\times 1} + b_{c\times 1} \ \# \text{ linear score function} \tag{327}$$

$$l = \textbf{loss} = \textbf{quantifies the errors by the learned parameters} \tag{328}$$

$$l = \frac{1}{|c_i|} \sum_{c_i} l_i \ \# \text{ average loss for all classes} \tag{329}$$

$$l_{SVM_i} = \sum_{y_i \neq c_i} \max(0, s_{y_i} - s_{c_i} + 1) \ \# \text{ SVM hinge class loss function:}$$
$$\# \text{ ignores incorrect classes with lower scores including a non-zero margin} \tag{330}$$

$$l_{MLR_i} = -\log\left(\frac{e^{s_{c_i}}}{\sum_{y_i} e^{y_i}}\right) \ \# \text{ Softmax class loss function}$$
$$\# \text{ lower scores correspond to lower exponentiated-normalized probabilities} \tag{331}$$

$$R = \textbf{regularization} = \textbf{optimizes the choice of learned parameters to minimize test error} \tag{332}$$

$$\lambda \ \# \text{ regularization strength hyperparameter} \tag{333}$$

$$R_{L1}(W) = \sum_{W_i} |W_i| \ \# \text{ L1 regularization} \tag{334}$$

$$R_{L2}(W) = \sum_{W_i} W_i^2 \ \# \text{ L2 regularization} \tag{335}$$

$$L' = L + \lambda R(W) \ \# \text{ weight regularization} \tag{336}$$

$$\nabla_W L = \frac{\overrightarrow{\partial}}{\partial W_i} L = \textbf{loss gradient w.r.t. weights} \tag{337}$$

$$\frac{\partial L_E}{\partial W_I} = \frac{\partial L_L}{\partial W_I} \frac{\partial L_E}{\partial L_L} \ \# \text{ loss gradient w.r.t. input weight in terms of external and local gradients} \tag{338}$$

$$s = \textbf{forward API} \ ; \ \frac{\partial L_L}{\partial W_I} = \textbf{backward API} \tag{339}$$

$$W_{t+1} = W_t - \nabla_{W_t} L \ \# \text{ weight update loss minimization} \tag{340}$$

$$\textbf{TODO:Research on Activation functions, Weight Initialization, Batch Normalization} \tag{341}$$

$$review5meanvardiscussion/hyperparameteroptimization/babysittinglearning \tag{342}$$

TODO loss L or l ??
